TITLE: METHOD FOR BACKUP AND RESTORE OF A MULTI-LINGUAL NETWORK FILE SERVER

Detail Description Paragraph:

[0071] The foregoing describes the technique for use in the network that includes a multi-lingual file system as may be used in the backup and restore processes. This general technique described is an efficient and flexible technique which returns multiple metadata or multiple file attributes associated with a single file with a single API call allowing backup and restoration of data from a single point included in a network. This type of backup technique and restore technique with a multi-lingual file is useful in an embodiment such as previously described in which various file systems have different attributes corresponding to the same data file.
